

# M+R Reference Project Milad Tower Tehran, Iran

Milad Tower, Tehran, Iran

This building was constructed between 2003 and 2006, and is the tallest building in Iran. The facades of the tower's head structure are 12,000m<sup>2</sup> in area.

M+R delivered the seals for the facades for this very prestigious building to a local facade construction company. Twelve different profile geometries were used in the project, and there were additional requirements to be met because of the local climate.

Additionally, the logistic and financial considerations made this a project that was particularly challenging.

## Project Details

- 12,000m<sup>2</sup> facade surface area
- 12 different profile geometries
- Constructed within 3 years
